

# Viasat - Take Home Technical Challenge - Frontend

## Brief

Using JavaScript and React, your assignment is to create a single page web application that displays SpaceX launch data utilising the free [SpaceX API](#) following the wireframe design provided. We expect this project to take 3-4 hours. If you find it's taking too long please just submit what you have time for completing as many functional requirements as you can.

## Functional Requirements

- Create a single page web application:
  - You may use any library & bundler you like, e.g. Vite, Create Next App or by bootstrapping your own project.
  - You may use a UI library to help you build components, e.g. Material UI
- Using the [SpaceX APIs](#), display the following:
  - A list of past and upcoming launches with
    - An image of the launch, title, details and flight number
    - Launch date in UTC formatted for (DD/MM/YYYY HH:MM:SS)
  - List should have pagination with max 12 launches per page
    - Next/Previous buttons
    - Page numbers
  - A filter should be displayed that allows data to be filtered by:
    - Unsuccessful launches
    - Past & upcoming launches
  - A filter query function that:
    - Searches date ranges
    - Changes result order by ascending or descending
  - A loading state when fetching from an API
  - A 'no results' state if no results are displayed
  - A persisted state in either local or session storage
  - A basic responsive design (at least 1 breakpoint)

## Submission Requirements

- All functional requirements met to the best of your ability
- Code is unit tested using whatever library you like (recommend React Testing Library)
- Separation of logical functions from your presentational components
- Interactive states are catered for, e.g. hover, focus
- Project shared on a git repository we can access
- Instructions for running the project, build and tests

## Optional requirements

- One end to end test
- WCAG 2.1 Accessible
